

DØNote 4678

Labeling of Cables and Associated Components of the Run IIb L1 Calorimeter Trigger Upgrade

Peter Renkel, Alan Stone, Rahmi Unalan

(Dated: November 30, 2005)

For the Run IIb L1 calorimeter trigger, a new labeling scheme is needed to describe the origin and destination of all types of cables. The information on each cable label should be clear, concise, unique and unambiguous. In addition, the associated components to which the cables are connected should be documented with schematics and descriptions. The labeling strategy outlined in this note is designed to satisfy all of the above mentioned requirements.

I. INTRODUCTION

The purpose of this note is to recommend a global labeling strategy for the Run IIb L1 Calorimeter Trigger System [1]. This strategy should be intuitive; in other words the cable labels should take their names from the subsystems to which they connect.

The principal components under consideration are:

1. Base Line Subtractor (BLS) trigger cables [2]
2. BLS-to-ADF Transition System [3]
3. Analog-to-Digital Filter (ADF) System [4]
4. Trigger Algorithm Boards (TAB) and Global Algorithm Board (GAB) system [5]

The three major cable groups connecting these subsystems are:

1. 1280 BLS cables which carry the analog trigger signals from the Calorimeter BLS racks at the detector platform to the BLS-to-ADF Transition System in the first floor of the Moveable Counting House (MCH).
2. 160 Pleated Foil cables (PFC) which carry the analog trigger signals from the BLS-to-ADF Transition System to the ADF Crates.
3. 240 Low-Voltage Differential Signaling (LVDS) cables are used to carry the digital signals from the ADF crates to the TAB Crate, and 8 LVDS cables carry the digital signals from the TABs to the GAB.

Finally, three other cable groups used in the trigger communication and readout are:

- 4 LVDS cables carry the Serial Command Link (SCL) signal from the Serial Command Link Distributor (SLCD) to the ADF Maestro boards.
- 9 VME/SCL cables handle the VME and SCL communication between the VME/SCL Distributor and the TABs and GAB.
- 18 optical cables carry the L1 CAL data from each of the TABs and the GAB racks to the L2 and L3 trigger systems.

Figure 1 shows the various Run IIb L1 Cal signal cables and associated subsystem components.

In this note, only the labeling of the three major signal cabling subsystems (BLS, PFC, LVDS) will be addressed. The SCL cables for the ADF subsystem are handled internally. The VME/SCL cables for the TAB/GAB subsystem are physically unique, small in number, and are also handled internally. At the time this note was written, the destination of the the optical cables (to L2 and L3) was not available, therefore the labeling scheme of the optical cables was deferred.

In order to assign an unambiguous and unique label to each cable, one needs its **origin** and the **destination**. Consequently, a detailed description of each of the principal components of the trigger system is provided in the following sections.

II. DESCRIPTION OF THE PRINCIPAL COMPONENTS OF L1 CALORIMETER TRIGGER SYSTEM

The L1 Calorimeter trigger system was designed to makes fast decisions every 132 ns. Every decision is either 'accept' or 'reject' based on the energy deposition of the event in the calorimeter. The energy information of an event is summed over a projective tower of Calorimeter cells and carried to the L1 Calorimeter trigger system by the BLS trigger cables. There are 1280 BLS trigger cables, and therefore 1280 trigger towers (TT). Each TT is comprised of an electromagnetic and a hadronic component. These BLS cables are the same cables used in Run I and Run IIa, connected to the trigger cards in twenty crates in ten racks in the MCH1 (Figure 2).

The current trigger electronics will be completely replaced for Run IIb. The ADF system is much more compact, and will only require four crates in four racks. The reduction in scale is illustrated in Figure 3.

In order to minimize the movement of the irreplaceable BLS trigger cables, a transition system to bridge the BLS trigger cables and the ADF crates was designed. The full details of the BLS-to-ADF Transition System can be found in [3, 8, 9]. The transition system consists of 80 Patch Panels Cards (PPC) (Figure 4), 160 Pleated Foil cables (PFC) and 80 ADF Transition Cards (ATC) (Figure 5).

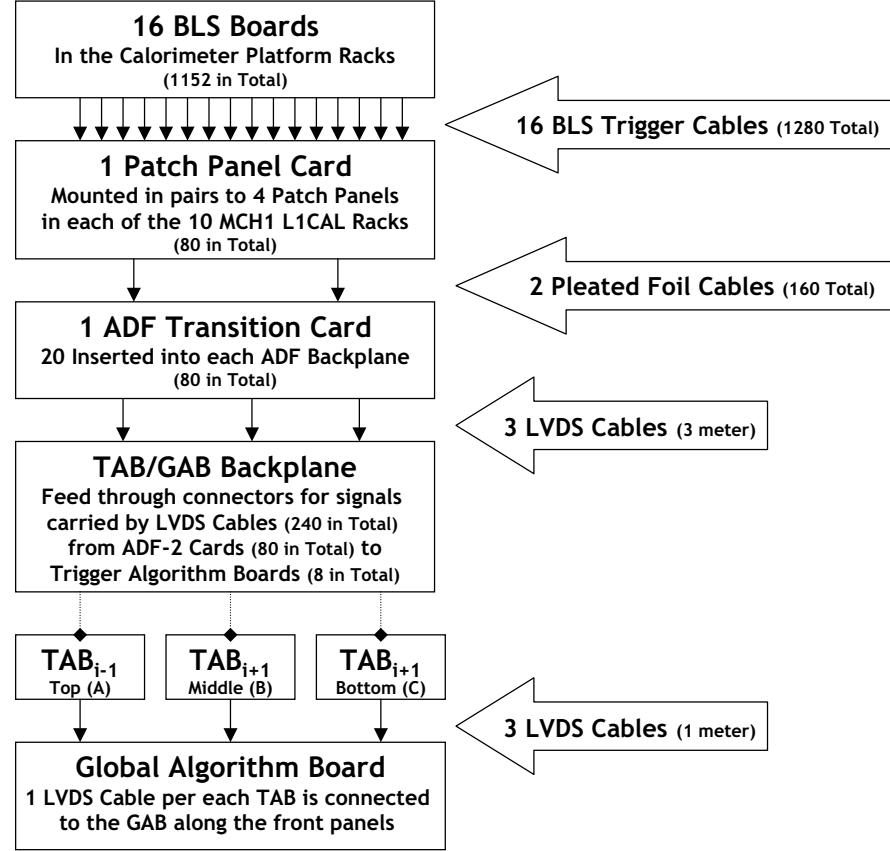

FIG. 1: Overview of the data flow through the Run IIb L1 CAL trigger system.

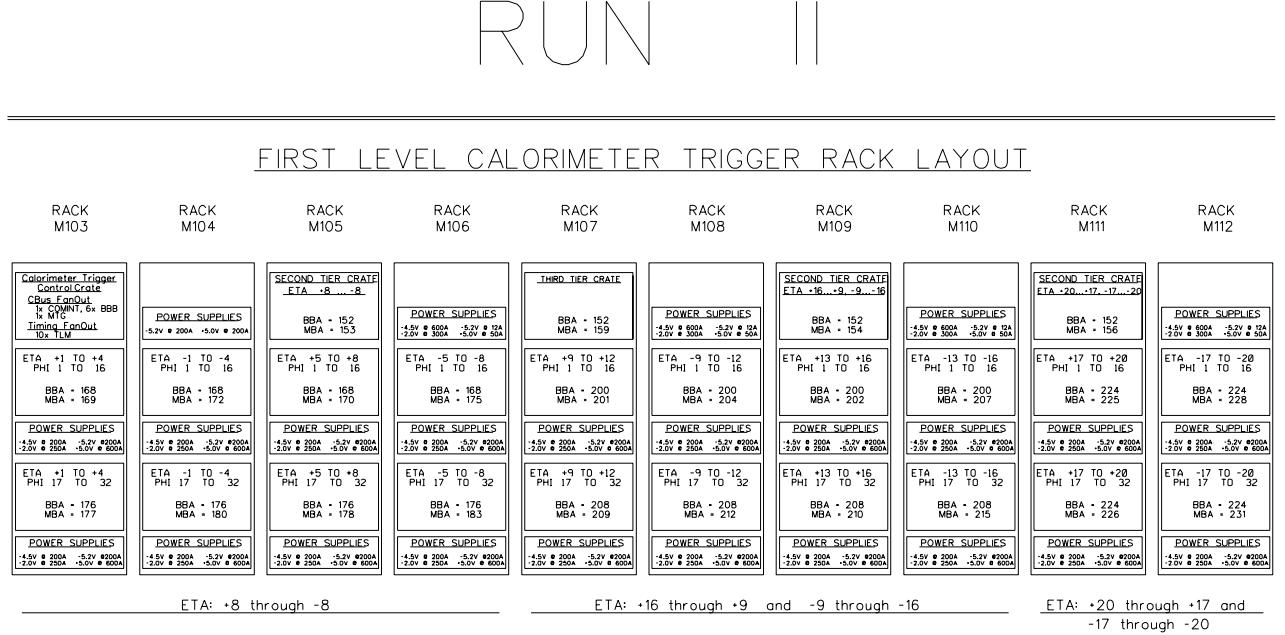

FIG. 2: Layout of the Run IIa L1 Calorimeter trigger electronics in MCH1 [6].

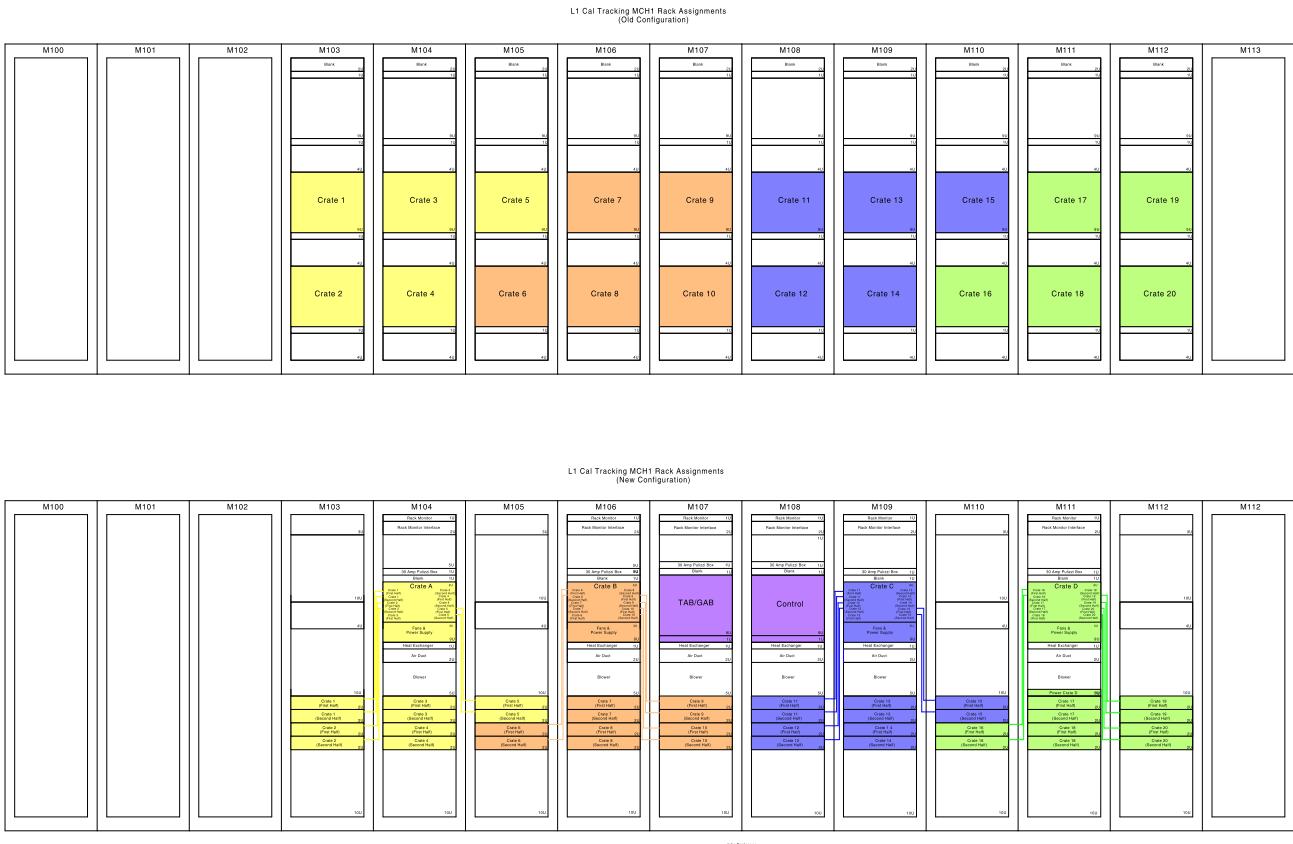

FIG. 3: Rack layout for the L1 Calorimeter trigger electronics on the south aisle of MCH1 for the current (Run I, Run IIa) system (top) and the upgrade (Run IIb) system (bottom). The color code illustrates the translation of signals from the current to the upgrade electronics [7].

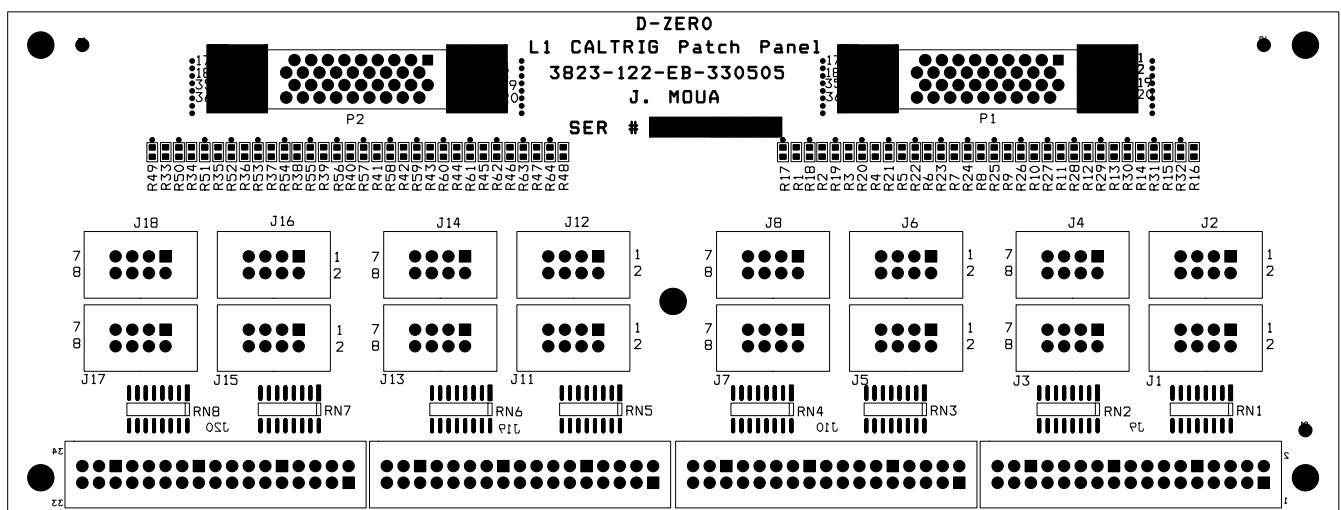

FIG. 4: A schematic view of a Patch Panel Card. The BLS trigger cables plug into the sixteen central connectors (J1-J8, J11-J18). The pleated foil cables plug into the two top connectors (P1-P2). The bottom connectors are for monitoring of all of the signal and ground connections [7].

There are 16 BLS cables which carry the TT signals to each PPC. Consequently, there are $80 \text{ (PPC)} \times 16 \text{ (inputs)} = 1280$ BLS cables to label. However, only the MCH1 end of the BLS trigger cable will be labeled as the other end inside the detector platform is inaccessible. There are two PFCs which carry the TT signals from one PPC to one ATC. Consequently, there are $80 \text{ (PPC)} \times 2 \text{ (PFC)} = 160$ PFCs to label (at both ends).

In order to cope with high luminosities in Run IIb, the L1 Cal trigger system needs higher rate of rejection compared to Run IIa. This is accomplished by a new sliding windows algorithm (SWA) [1]. SWA is implemented by the Trigger

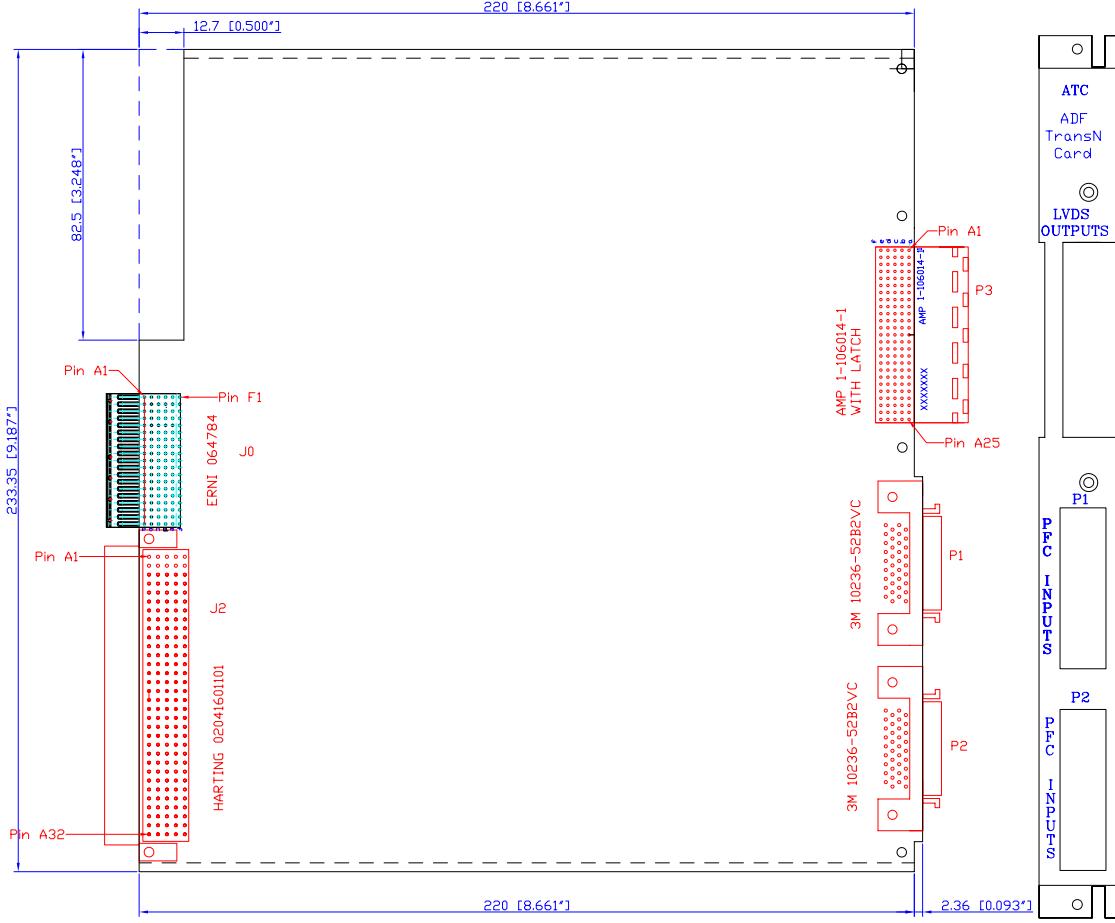

FIG. 5: A schematic view of the ADF Transition Card (left) and faceplate (right) [7].

Algorithm Boards (TAB). There are eight TAB boards. Digitally filtered signals will be sent from the ADF boards to the TAB boards by LVDS cables (3 meters in length). Every ADF card sends three copies of its signal to three different TAB boards. Therefore $80 \text{ (ADF boards)} \times 3 \text{ (copies)} = 240 \text{ ADF-to-TAB 3 m LVDS cables}$ which connect the ADF and TAB subsystems need to be labeled (at both ends).

The global decision will be made by the Global Algorithm Board (GAB). The TAB boards are connected to the GAB by 8 TAB-to-GAB 1 m LVDS cables. Figures 6 and 7 show the the schematics of the TAB and GAB faceplates and the TAB/GAB backplane respectively.

III. CABLE LABELING SCHEME

The convention for labeling cables is as follows:

1. Every cable has a unique name
2. Every label will have a unique origin and destination
3. Names will comprise L1CAL_R2B_[CABLE TYPE][CABLE NUMBER]
4. The origin and destination will be based on [RACK]-[CRATE(if any)]-[CARD or SLOT]-[CONNECTOR]

The patch panels, patch panel cards, pleated foil cables, ADF transition cards, ADF crates and backplanes and LVDS cables are all identical in design and construction and function. However, the trigger signals are required to pass through the subsystems in a very particular order. The following naming rules were established to insure that all cables and associated components have unique and unambiguous names.

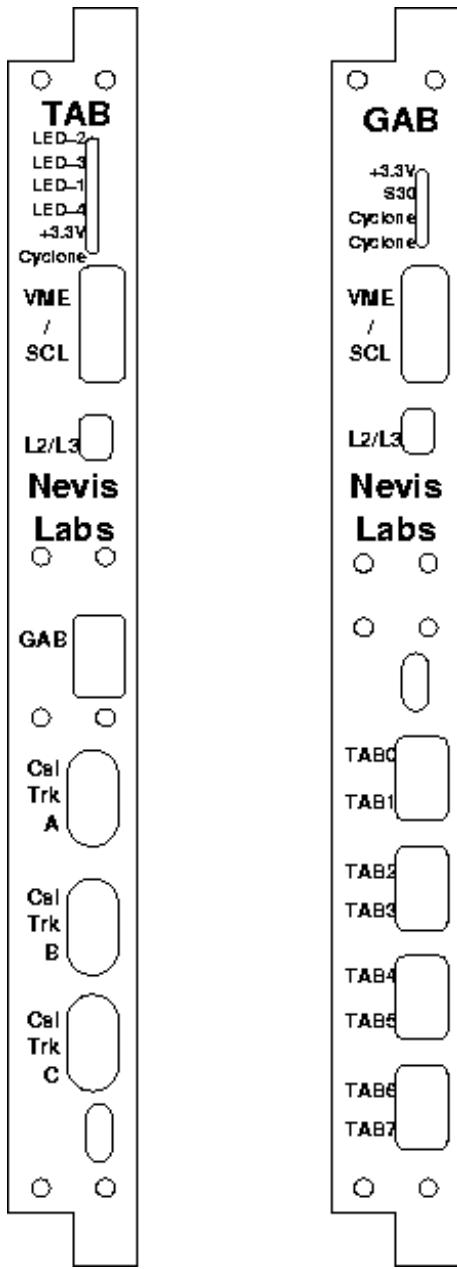

FIG. 6: The schematic view of the TAB and GAB faceplates. The TAB-to-GAB LVDS cables are routed from the ‘GAB’ window on each of the TAB faceplates to the ‘TAB0’ through ‘TAB7’ windows on the GAB faceplate [5].

1. The rack label can take one of ten values from M103 through M112 (Figure 8).
2. There are four Patch Panels in each rack. The PP label can take values of PP1 through PP4.
3. There are two Patch Panel Cards on each rack Patch Panel. The PPC label can take values of C1 or C2.
4. There are two Pleated Foil Cable outputs on each Patch Panel Card. The PFC label can take values of P1 or P2.
5. There are sixteen BLS trigger cable inputs to each Patch Panel Card. The BLS label can take values of J1 through J8 and J11 through J18.
6. The origin of the BLS trigger cable at the Calorimeter detector platform will not change, so the label values will be reused [10]. However, to remove ambiguity on the order of trigger tower coordinates of eta and phi, a ‘+’ or

FIG. 7: The schematic view of the TAB/GAB backplane. The vertical dimension provides the user the specific Sliding Window (SW) channel (0-9) on a TAB, the eta range of the trigger towers, and from which ADF crate the signals are arriving. The horizontal dimension provides the user the specific TAB (0-7) and the phi range of trigger towers. Three LVDS cables (A,B,C) are plugged into each of the 80 connectors. The central column is reserved for the GAB-to-TFW daughtercard [11].

- '-' sign was placed in front of all eta values which has a range of +1 to +20 and -1 to -20. The phi coordinate is always positive and has a range of 1 to 32.
7. There are four ADF crates in four separate racks. The ADF crate label can take values of M104, M106, M109 or M111.
 8. There are twenty ADF Transition Cards which slide into one of twenty-one slots of each ADF backplane. The first slot is always reserved for the Vertical Interconnect slave. Therefore, the ATC label can take values of ATC01(SL02) through ATC20(SL21).
 9. There are three LVDS cables which plug into each ATC and each TAB/GAB backplane connector. The ADF-to-TAB LVDS label can take a value of A, B or C.

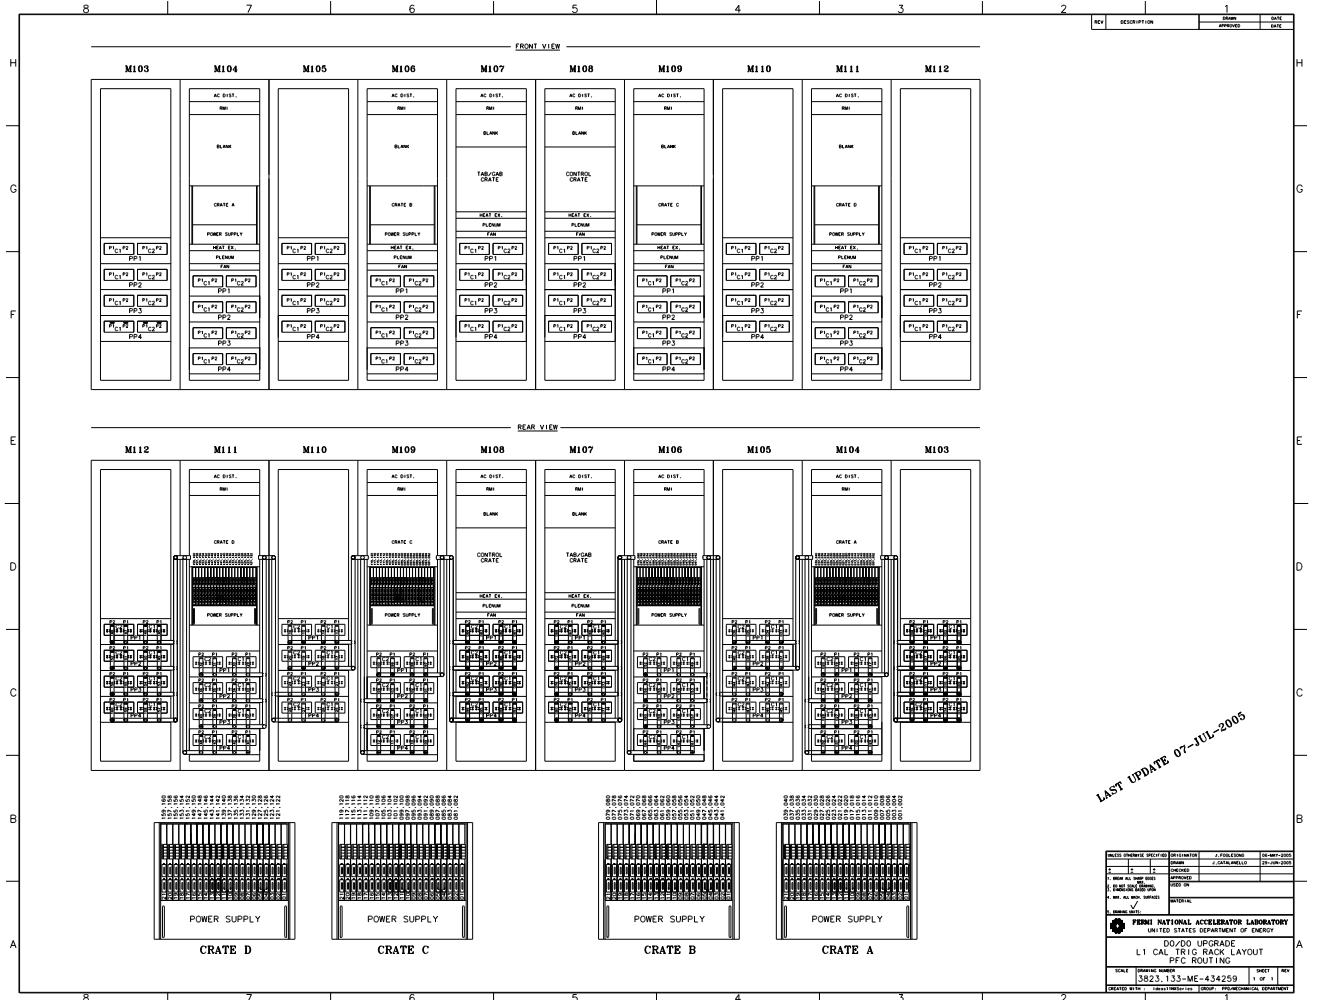

FIG. 8: A schematic view of the Run IIb racks M103-112 from the front (top) and rear (bottom). From the front, one sees four patch panels near the bottom of each rack and the placement of the PPCs. From the rear, the placement of the ATCs is shown, as well as the routing of the PFCs [7].

10. There are nine columns of connectors on the TAB/GAB backplane (Figure 7) where the middle column is reserved for the GAB-to-TFW daughterboard. The columns of TAB/GAB backplane connectors can take values of TAB0 through TAB7.
11. There are ten rows of connectors on the TAB/GAB backplane. The rows of TAB/GAB backplane connectors can take values of SW0 through SW9.
12. One LVDS cable connects each TAB to the GAB along the front of TAB/GAB crate. The TAB-to-GAB LVDS cable can take values of TAB0(CH0) through TAB7(CH7).

Examples of the each type of cable label are illustrated in Figure 9. Although the dimensions are to scale, the font size and type may change to adapt to the laser printer used for the label production. The complete description of all of the four types of cable labels is provided in Appendices A-D.

For the BLS trigger cable, Brady lasertab label model LAT-35-361 is a good fit. For the Pleated Foil and LVDS cables, Brady lasertab label model LAT-27-361 accomodates the cable size and label text.

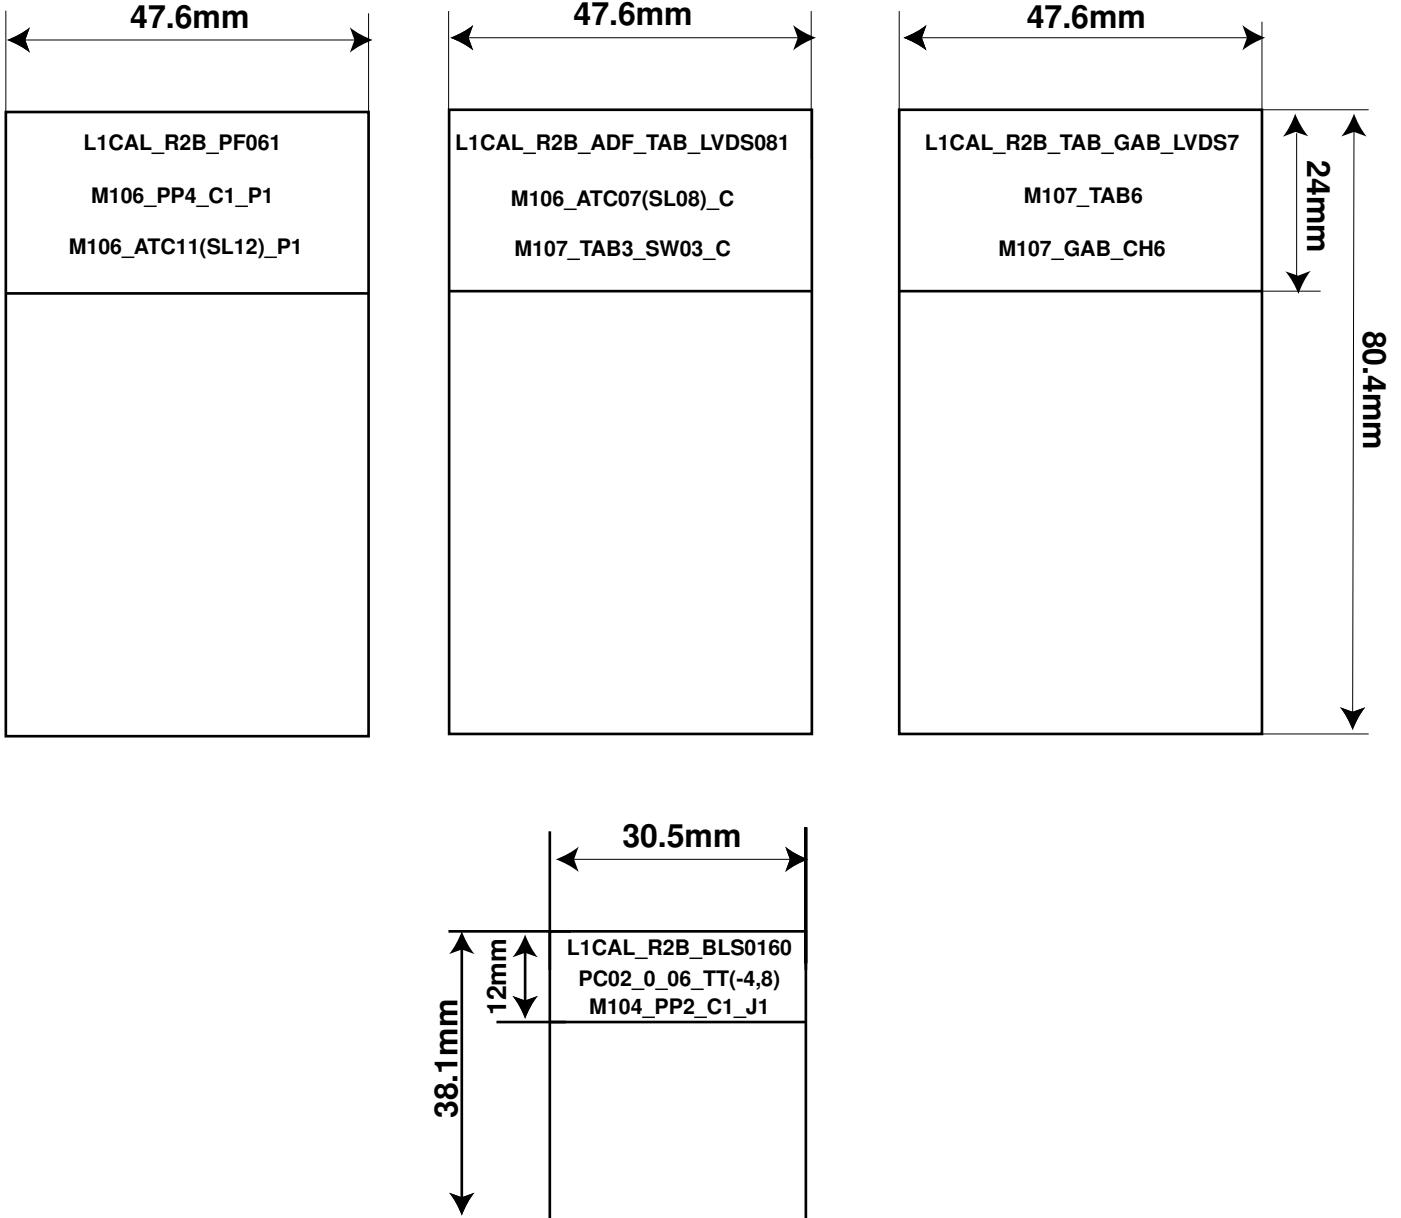

FIG. 9: Examples of labels for the Pleated Foil Cable (top, left), ADF-to-TAB LVDS Cable (top, middle), TAB-to-GAB LVDS Cable (top, right) and BLS Trigger Cable (bottom). Dimensions are to scale.

Appendix B:

The complete description of all of the Pleated Foil cable labels. The three columns provides the cable 'NAME', the 'ORIGIN' and the 'DESTINATION'.

Appendix D

The complete description of all of the TAB-to-GAB LVDS cable labels. The three columns provides the cable 'NAME', the 'ORIGIN' and the 'DESTINATION'.

L1CAL_R2B_TAB_GAB_LVDS0	M107_TAB0	M107_GAB_CH0
L1CAL_R2B_TAB_GAB_LVDS1	M107_TAB1	M107_GAB_CH1
L1CAL_R2B_TAB_GAB_LVDS2	M107_TAB2	M107_GAB_CH2
L1CAL_R2B_TAB_GAB_LVDS3	M107_TAB3	M107_GAB_CH3
L1CAL_R2B_TAB_GAB_LVDS4	M107_TAB4	M107_GAB_CH4
L1CAL_R2B_TAB_GAB_LVDS5	M107_TAB5	M107_GAB_CH5
L1CAL_R2B_TAB_GAB_LVDS6	M107_TAB6	M107_GAB_CH6
L1CAL_R2B_TAB_GAB_LVDS7	M107_TAB7	M107_GAB_CH7
